

Double deep Pallet Racking

Double deep Pallet Racking

Double deep racking is created by placing 2 double sided runs together. Pallets are stored 2 deep and are accessed using special trucks with pantograph or telescopic forks.

Double deep Pallet Racking

- Greater use of floor space by reducing number of access aisles.
- Not suitable for rapid stock rotation – first pallet in is the last one out.
- Less distance for the fork – lift truck to travel.
- Increased storage capacity.
- Better space utilization.
